

## Financials

# External Systems Interface (ESI)

Dramatically reduce the time and costs of integrating TechnologyOne solutions with third party systems. Ensure upgrades integrate correctly, eliminating future customisation problems.

- Integrate third party products using the External System Interface
- Easily import data from third party systems
- Guarantee integrity of data through validated information
- Scalable to suit large data imports

## Key features and benefits

### Integrate third party products with TechnologyOne solutions

Ensure all transactions from third party solutions are received and updated in the required tables. All processes can be scheduled to occur overnight or at any user-defined frequency, with full error logs and emailed notifications.

### Guaranteed integrity of data

ESI operates as a standard interface between TechnologyOne solutions and external systems. Utilising standard data entry tools and protocols to validate all data, ESI will guarantee the integrity of TechnologyOne Financials.

### Validate information

ESI provides a set of standard routines that can be utilised by external systems to validate account numbers and return financial reference information, such as names, addresses and descriptions.

### Scalable

The external system posting option has been specifically designed for large volume imports. Eliminate validation logic that may be unnecessary for regular imports, and ensure large volumes of data can be imported in the shortest possible time.

### Templated approach

Standard templates are provided for all external interface processes. These templates are easily used by external systems, with each field having an explanation for population.
